### Abstract

Benzofuran derivatives are known possess hypotensive<sup>(1)</sup>, vasodilating and spasmolytic activity<sup>(2)</sup>. Moreover, some benzofuran derivatives showed antibacterial activity as well as antiparasitic properties<sup>(3,4)</sup>. On the other hand substituted pyridine showed herbicidal<sup>(5)</sup> and antibacterial activities<sup>(6)</sup> compounds having both pyridine and benzofuran moieties can be expected to possess marked biological activities.

### Chemistry:

3-[4,7-Dimethoxy-6-hydroxy benzofuran-5-yl] buta-1,3dione(**1c**)<sup>(7)</sup> reacted with  $\alpha$ -thiocynoamide in presence of ammonium acetate<sup>(8)</sup> to give 2-mercapto-3-cyano-4-methyl-6-[4,7dimethoxy-6-hydroxybenzofuran-5yl] pyridine [**2c** or possible isomer **3c**] (Scheme I)

(Scheme I)

Compound **2c** was confirmed by elemental analysis (Table II) and spectroscopic evidence.

The reaction of compounds **2a-c** or its isomer **3a-c** with chloro acetone<sup>(9)</sup> gave pyridine derivatives<sup>(10)</sup> (**4a-c**). Their H<sup>1</sup>NMR spectra showed the methylene group at ( $\delta$ ,4.15,4.13,4.18) respectively. Heating of **4a,c** with malononitrile and ammonium acetate gave **5a,b** (Scheme II).

(Scheme II)

Compound 4<sub>a-c</sub>, 5<sub>a-c</sub> were confirmed by elemental analysis (Table II) and spectroscopic data.

Methylation of 2<sub>a-c</sub> or its isomer 3<sub>a-c</sub> in presence of sodium and methyl iodide in ethanol at room temperature gave 2-mercaptopyridine derivatives (6<sub>a-c</sub>). Treatment of compound (6<sub>a-c</sub>) with excess of hydrazine hydrate in hot ethanol gave pyrazolopyridine derivatives (7<sub>a-c</sub>). IR showed (NH<sub>2</sub>/NH) at 3340 & 3213 cm<sup>-1</sup>. Condensation of compounds 6<sub>a-c</sub> with thiourea, sodium ethoxide in hot ethanol gave the pyridopyrimidine derivatives 8<sub>a-c</sub>. (Scheme III)

(Scheme III)

Alkylation of 2-mercapto-3-cyano 4-methyl-6-[4,7-dimethoxy-6hydroxybenzofuran-5-yl] pyridine (3<sub>c</sub>) with ethylchloroacetate in presence of sodium acetate in dry acetone, yielded pyridine thioacetate derivative (9). Condensation of compound (9) with hydrazine hydrate in ethanol afforded the corresponding

3-cyano-4,6- disubstituted-2-pyridinylthioacetyl hydrazine (10) (Scheme IV).

Ethanol solution of **3c** with primary aromatic amines such as aniline and *p*-toluidine gave the corresponding 2-aminopyridine derivatives (**11<sub>a,b</sub>**). Similarly, reaction of **3c** with hydrazine hydrate and phenyl hydrazine afforded the corresponding 2-hydrazino and phenylhydrazino-3-cyano-4-methyl-6-substituted pyridine derivatives respectively (**12<sub>a,b</sub>**).

**Antimicrobial activity**

The standardized disc-agar diffusion method (Bauer Kirby 1966) was followed to determine the activity of the synthesized compounds against the sensitive organisms *Staphylococcus aureus* (ATCC 25923) and *Streptococcus pyogenes* (A TCC 19615) as Gram positive bacteria, *Pseudomonas fluorescens* (S 97) and *Pseudomonas phaseolicola* (GSPB 2828) as Gramnegative bacteria and the fungi *Fusarium oxysporum* and *Aspergillus fumigatus*.

The broad spectrum antibiotic chloramphenicol was used as standard antibacterial reference and cicloheximide was used as standard antifungal reference. The tested compounds were dissolved in dimethyl formamide [(DMF) which have no inhibition activity] to get concentrations of 2 mg / ml and 1 mg / ml. The test was performed on medium potato dextrose agar (PDA) which contains infusion of 200 g potatoes, 6 g dextrose and 15g agar.

Uniform size filter paper disks (3 disks per compound) were impregnated by equal volume (10μl) from the specific concentration of dissolved tested compounds and carefully placed on inoculated agar surface.

After incubation for 36 h at 27°C in the case of bacteria and for 48 h at 24°C in the case of fungi inhibition of the organisms which evidenced by clear zone surround each disk was measured and used to calculate mean of inhibition zones. The activity of tested compounds were categorized as follows

- Low activity = Mean of zone diameter  $\leq$  1/3 of mean zone diameter of control.

- Intermediate activity = Mean of zone diameter  $\leq 2/3$  of mean
- High activity = Mean of zone diameter  $> 2/3$  of mean zone diameter of control.

تحضير وتفاعلات بعض مشتقات 2-مركبتو 3-سيانو بنزوفيوران

المتوقع لها نشاط بيولوجي

نادية محمد صالح محمد

كلية العلوم - جامعة الازهر (بنات)

بتفاعل مشتقات البنزوفيوران مع ثيوسيانو اسيتاميد حضرت إنتاج مركبات تم تفاعلها مع كلورواسيتون ، مالونونيتريل ثم تم تفاعله أيضا مع يوديد المثيل والثيويوريا والهيدرازين هيدرات لتعطي مركبات لها بعض النشاط البيولوجي .

كما تفاعل الخليتون ميثيل ايثر 2-مركبتو 3-سيانوكلوروخلات الإيثيل مع الهيدرازين هيدرات والأمينات ليعطي مركبات جديدة لها بعض النشاط البيولوجي .

وقد تم إثبات تركيب المركبات بواسطة الأشعة تحت الحمراء والرنين النووي المغناطيسي وطيف الكتلة .
